

Replace background

Last updated on Jun 26, 2025

Quickly and easily replace backgrounds and create seamless results without altering your original image.

Try it in the app

Use Generative fill to replace or remove the background of your image within seconds.

Go to the **Generative fill** feature on the [Adobe Firefly website](#).

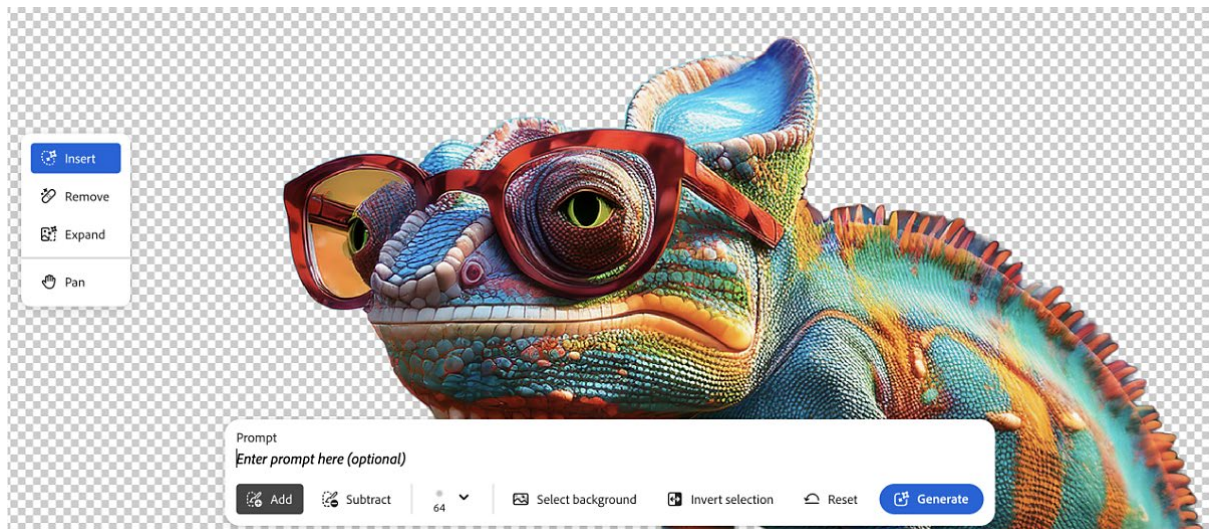

Upload an image or select a sample asset from the gallery.

Upload any image of your choice or use a sample asset.

Choose **Select background**.

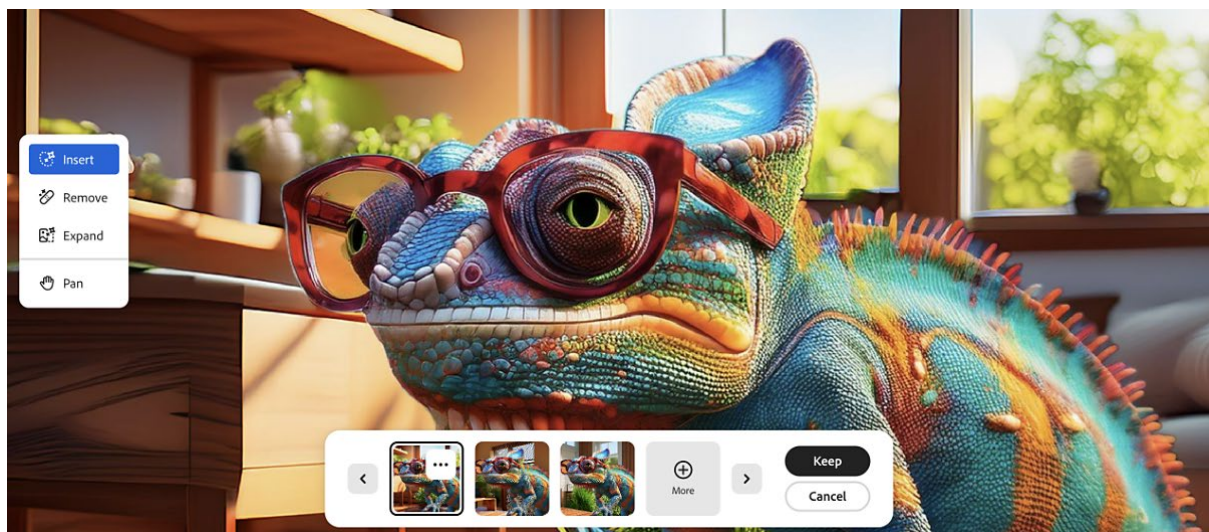

Add a detailed description to the **Prompt** field explaining how you want to change the background, and then select **Generate**. If you leave the description blank, the background will be filled depending on the surroundings.

Change the background to something visually stimulating or completely remove the surrounding clutter and background noise.

Choose an image from the generated results or select **More** to generate new variations.

Select **Keep** to continue with the selected image, or select **Cancel** to discard the variations.

Browse through the generated options to select the one that best matches your vision.

After the image is ready, select **Share** to copy your image or open it in Adobe Express for further editing, or select **Download** to save the image locally with content credentials added automatically.

Note

To provide feedback on the quality and accuracy of a variation or report it for being problematic or offensive, select the three dot icon on a variation and then rate or report the content.
